

This book of Michel Innocent Peya is devoted to the Congo Basin, the second largest reserve in the world: its natural resources, its mysteries, legal and institutional frameworks, national, subregional and international levels that protect it. The basin of Congo is an African opportunity for the whole world. Its preservation and its protection over time are an action of conscience, will, commitment, determination and sacrifices for the benefit of humanity. Nature cannot be defending alone; the Congo Basin finds among his children in love with nature a spokesperson or a soulmate in the person of the President of the Republic of Congo, Denis Sassou N'Guesso. He is one with nature.

This is why, time and time again, he cries out against the abusive and irrational exploitation of the Earth, which is the source of delayed natural disasters, irreversible, and mass destruction : the Bomb "N". This saving son of the world demonstrates his involvement by his career and his advocacy at several international, subregional and national summits on protection of the global environment. This book puts in the world place the intrinsic qualities of its international environmental policy, an arduous fight for thirty years for the preservation of nature, the balance of global climate. It plays the role of a climatoecological pivot in the Congo Basin subregion. His climate leadership is the result of coordinated sectoral planned policies, implemented, objectives clearly defined and adapted, credible and effective diplomacy.

His sacrifices for humanity, its dedication to the cause of our planet and its management for the future of humanity and future generations give it the status of patrimonium of mankind. Protector as well as defender of the Congo Basin, he receives the blows and the backlash from mafia networks who wish to illegally exploit the huge resources of this part of the Earth. It reveals to the donor community climatic conditions and to all human civilization the opportunities offered by the Congo (ecotourism, development of the pharmaceutical industry and the market Common Forest of Central African Countries). Peat bogs constitute for the Congo Basin the largest terrestrial reserve of organic carbon. They store twice as much carbon as other forests in the world. He calls on the conscience of climate hinders, because the peat bog is an essential source of ecological stability, a precious reserve of carbon and the cradle of unique flora and fauna to the world and its survival also requires the integration of local communities' indigenous peoples through sustainable projects.

This book is a reference tool for understanding and analyzing the basin of Congo, its natural wealth, its legal and institutional framework, in the dynamics of climate-political leadership and its myriad opportunities for the planet. As a result, the author believes that the achievement of these objectives is dependent on climate-political leadership that the Congo Basin space exerts in the concert nations. As it is said in Africa, one finger cannot wash the whole face.

Michel Innocent PEYA, a native of Congo-Brazzaville, is a doctor in Management Sciences, Financial Management option. His research focuses on the management of organizations and the practice of democracy in Africa. He is an engaged researcher and the author of several books.
